Instrument 10 — Buyer Red Flags *(Chapters 3, 4, 9)*

The telltale flags, in the chapter's own terms: no AI governance lane; no named executive owner; access without training; tools distributed through the help desk.

For vendors qualifying accounts and investors qualifying their companies' revenue. No AI governance lane — no intake, no criteria, no supervision levels — so decisions will be made by altitude and mood. No named executive owner for the deployment. Access without training plans; tools distributed through the help desk; nobody tracking who has what. A CEO-sourced vendor proceeding without comparison. Scar tissue unexamined: nobody has asked what the last three vendors in this category left behind. A pilot accepted with no success definition, no end date, and no owner. Revenue signed into these conditions has no anchor under it: price it accordingly.
